

In-hospital mortality by hour-16 SCAI proxy stage

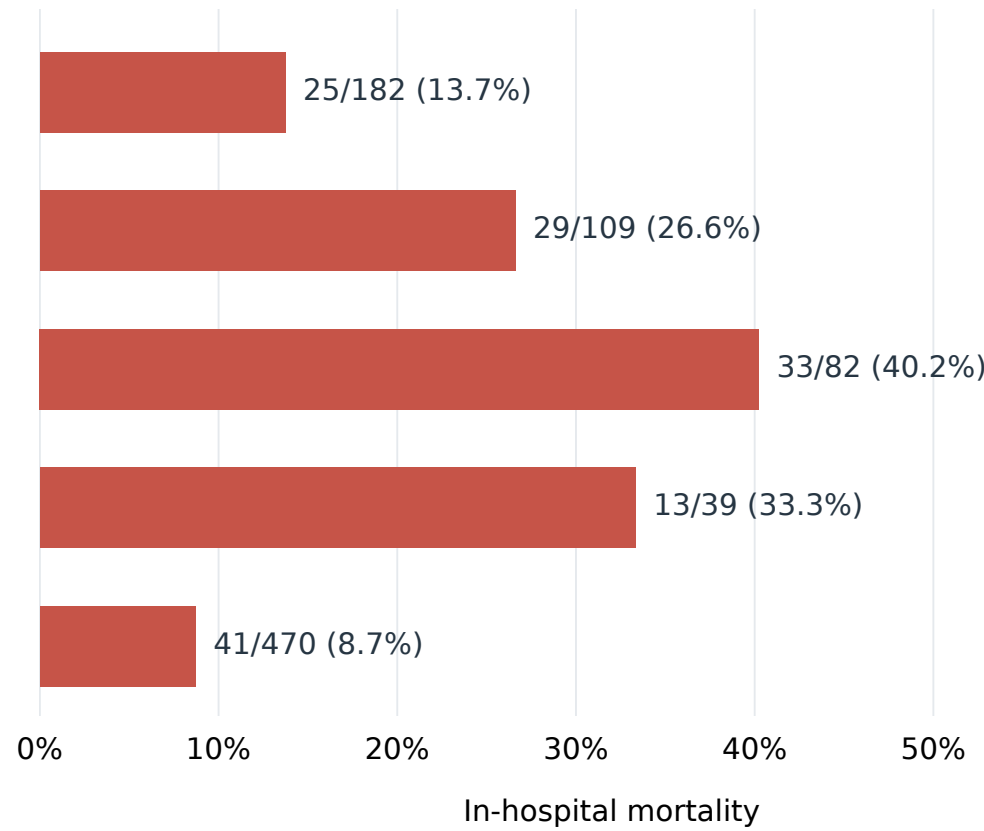

Mortality model sample: 156/900 deaths (17.3%). Stage bars include 882 stays alive and in the ICU at hour 16.

■ In-hospital death ■ Survived to hospital discharge

Deaths and survivors within each category

Mortality rate within each category

Outside the stage bars: 15 deaths by hour 16; 3 earlier ICU departures/discharges (0 in-hospital deaths).

Stage A is unavailable. B-E are minimum evidenced proxy stages; unclassified does not mean normal.

Rates are descriptive and unadjusted, conditional on being alive and in the ICU at hour 16; deaths before staging are not assigned a stage.

Physiology: latest valid value in hours 12–16; treatment at hour 16. Counts are ICU stays, not unique patients.
